

IPhoneLocator Installation Guide

- For Vera UI5 1.622
- November 15th 2013
- based on a version V1.60 installed from the application store
- @amg0
- User Guide documentation : <http://forum.micasaverde.com/index.php/topic,16907.0.html>

1	Install the Plugin from the application store	
2	Wait while files are downloaded	
3	Wait until you get this message	
4	The plugin display in the Devices page should be	
5	Go into "Settings" tab for the device. You should see these values except the Home Lat , Home Long, which by default , should be your VERA declared location	

6	<p>Type your iCloud email and password and leave the password field (with the tab keys or with a mouse click)</p> <p>Everytime you change your password and leave the field (with the tab keys or with a mouse click) it will go and refresh device name list from the iCloud information. An empty list is a sign of wrong email or wrong password or no internet connection !</p>	
7	<p>You should see this button “refreshing...” while the device is contacting iCloud to find your device names</p>	
8	<p>Then if email + pwd is correct you should see the pick-list of devices from your iCloud account. Pick one and click on the “→” button to transfer it into the list of selected devices you want to track</p> <p>Selected devices or pattern matchin should end up in the right hand list (selected list).</p> <p>You can delete from that list with the “X” button</p>	 <p>Or use pattern matching like “.*” to get tracking for all devices in your account:</p>
9	<p>Change your other parameters as you want. Refer to the documentation available at :</p> <p>http://forum.micasaverde.com/index.php/topic,16907.0.html</p>	
10	<p>Click on the Save Needed button, it will turn Green while saving then back to normal blue.</p>	

11	Close the device window and check the display in the DEVICE page	
12	Force a refresh and see it being updated for the first time. Notice the icon telling you the device is approaching (the default pole north location was probably further than your new configured home location)	
13	After a while (depending on your polling settings) it will refresh and show a stable icon most likely	
14	For root devices that manage more than one iCloud device, you will need one or 2 LUA reloads at this step in order to force the creation of child devices, one per iCloud device selected in your selected device list	LUA RELOAD BUTTON
15	After lua reload (if needed) the map setting page should now work	
16	You can create scene, PLEG or simple device notifications
